LÁSKOK - SZEMÉLYES VÁRÁSOK .css. js. css. style. if. include. utf8. PHP is one of the most commonly used programming languages in the world today. What is PHP? PHP is a free open source scripting language that is designed to help web authors create dynamic and interactive web pages and applications. The World Wide Web Consortium has designated PHP as a Recommendation. PHP is the name of both the language and the official website. PHP has been used in over a billion web sites and it is used to build sophisticated applications with all kinds of features, from the simplest and easiest to the most complex and difficult. PHP is an acronym for "Personal Home Page". This is not a joke or a play on words, but a literal description of what the project stands for and what it does. What is this (PHP)? PHP ("Personal Home Page") is a general purpose programming language that is used to build web-based applications. PHP runs on the server, and not on the client computer. It is used to develop web pages and applications that work together using a combination of PHP code and HTML and a server. PHP is not a markup language or a replacement for HTML, but it is more than that. It can do the same things as HTML, but much more, and in many ways much better. It is used to build programs that run on the web. In other words, PHP is a language that you can use to create web pages that can be used to store and display information, communicate with users and do anything else that you can do with HTML. What is PHP? PHP is used to create dynamic web pages that can do many things. They can show information to users, gather information from users, accept information from users, create information for users, update information for users, and even communicate with users. All of these things are possible with PHP. PHP is not a markup language. It is not HTML or XML. The thing is, HTML is used to create web pages, not to create programs. HTML was designed to describe the appearance of web pages and nothing more. HTML was designed to describe the appearance of web pages and nothing more. PHP is a programming language that lets you create HTML documents. That's it. You can use it to do a
